MIS & Business Analytics Executive — First Round Assignment

Time: 2–3 hours
Format: - Part A: Submit as a shared Google Sheet
- Part B: written responses ,Submit as a shared Google doc
Data: `gramiyaa_retail_sales_jun_jul_2026.csv` (attached)

Before you start

This is retail secondary sales data across 5 distributors, multiple outlets and SKUs for June–July 2026. It has real-world issues — inconsistent naming, a few missing values, duplicate rows, some format inconsistencies. Cleaning it is part of the task, not a distraction from it.

Part A: Dataset Task (import into Excel/Google Sheets)

A1. Clean the data Identify and fix (or clearly flag, with your logic) at least:

- Inconsistent distributor names that refer to the same distributor
- Duplicate rows
- Missing values
- Any other inconsistencies you spot (e.g. inconsistent date formats, inconsistent SKU naming)

Keep your cleaning steps visible — either a short "cleaning log" tab or clear formulas, not just a silently edited file.

A2. Build a summary/dashboard view Using pivot tables and/or charts, produce a view that shows, for June and July separately and MoM change:

- Total sales value by distributor
- Total sales value by category and by SKU
- Number of active outlets per distributor (outlets with at least one transaction)
- Top 3 and bottom 3 SKUs by sales value

A3. Call out one gap or anomaly Looking at the cleaned data, flag one thing that would concern you if this were real business data (e.g. a distributor with unusually low outlet coverage, a SKU with a steep MoM drop, a beat with no activity). One or two sentences on what you'd check next.

Part B: Case Questions (written, ~150–250 words each)

B1. KPI dip Total secondary sales value for one distributor drops 20% month-on-month. You have access to an RTA/DMS platform (like Bizom), Google Sheets, and the field sales team. Walk through how you'd investigate this — what data you'd pull first, what you'd rule in/out, and who you'd loop in.

B2. Messy multi-source reporting The Founder's Office wants a weekly report combining Blinkit/Zepto/Instamart sales, offline secondary sales (from the RTA platform), and Amazon/Shopify data — currently spread across 4 different sheets maintained by different people. How would you approach consolidating this into one reliable, repeatable report? Mention the tools you'd use and how you'd keep it maintainable.

B3. Ad-hoc request The Founder's Office asks, with no further detail: "Can you tell us which outlets we should stop servicing?" How would you scope this request before touching any data — what would you ask, what would you need, and what would your first-pass output look like?

What we're looking for

Technical execution (cleaning, pivoting, correctness) matters, but so does how you think about the business and how clearly you communicate it. We're paying attention to:

- Whether your numbers are actually correct after cleaning
- Whether your dashboard view is something a founder could read in 30 seconds
- Whether your case answers show real judgment about *what* to investigate and *why*, not just a generic checklist
- Whether your written answers are clear and structured, not padded
- flag your assumptions if you don't get an answer in time.
